13. ABSTRACT (Maximum 200 words) Subchronic toxic effects of N-Methyl-N, 2,4,6-Tetranitroaniline (tetryl) in male and female Fisher 344 rats were evaluated by feeding powdered certified laboratory chow supplemented with varied concentrations of tetryl (0, 200, 1000 and 3000 mg/kg diet) for ninety days. There were no clinical signs of toxicity or early deaths. Food intake was reduced in both sexes at all dose levels throughout the study and resulted in a significant decrease in terminal body weights in the 3000 and 1000 mg tetryl dose groups. The calculated average tetryl dosage was 14, 69 and 199 mg/kg/day for females and 13, 62 and 180 mg/kg/day for males. An increase in the relative liver and kidney weights in both sexes in the 3000 and 1000 mg tetryl dose groups and an increase in the relative spleen weight in the 3000 mg dose group were noted. Hematology and clinical chemistry analyses were done at 45 and 90 days exposure. Methemoglobin levels were increased in both sexes in the 3000 and 1000 tetryl dose groups at 45 and 90 days while hemoglobin was decreased in these same groups at 90 days. The red blood cell count was decreased in the 3000 mg tetryl dose group of both sexes while the reticulocyte count was increased in this same group. Cholesterol levels were increased in all dose groups in both sexes at 90 days. Histopathological examinations suggested that susceptible organs for tetryl toxicity were spleen (pigment deposition and erythroid cell hyperplasia) and kidneys (tubular degeneration and cytoplasmic droplets). A no observed adverse effect level (NOAEL) of 13 mg/kg/day was established.

Compliance Statement

This study was conducted in compliance with the Good Laboratory Practice Regulations as set forth in Title 21 of the U.S. Code of Federal Regulations Part 792 issued August 17, 1989. All deviations from the protocol and/or GLPs are listed in Appendix J. There were no deviations from the aforementioned regulations which affected the quality or integrity of the study or the interpretation of the results in the report.

INTRODUCTION

Nitroaromatics, such as 1,3-dinitrobenzene (DNB), 1,3,5-trinitrobenzene (TNB), and N-methyl-N,2,4,6-tetranitroaniline (tetryl), have been detected as environmental contaminants of groundwater and soil near production sites and in some instances at military test grounds. TNB is formed during the nitration step of TNT synthesis as a result of oxidation of methyl groups. Although the complete mechanism of TNB formation during TNT photolysis is unknown, it has been suggested that it is produced by decarboxylation of 2,4,6-trinitrobenzaldehyde, a major TNT photoproduct (Burlinson, 1980). It is also found in aquatic systems and surface soils as a by-product of photolysis of TNT. DNB and TNB are not easily biodegradable, persist in the environment, eventually leach out, and contaminate groundwater near waste disposal sites. Tetryl is an explosive that has been in use, largely for military purposes, since 1906. Wastewaters and soil at the original production sites and other plants devoted to munitions assembly, contain large quantities of these compounds (Walsh and Jenkins, 1992).

Toxicity data on these compounds are limited. The oral LD₅₀ of DNB, TNB and tetryl were 59 mg/kg, 284 mg/kg and greater than 5 g/kg, respectively, in rats for combined sexes. TNB and tetryl were not toxic at 2 g/kg when applied to rabbit skin for 24 hours. However, the dermal LD₅₀ of DNB was 1.99 g/kg for combined sexes of rabbits. None of these compounds produced skin irritation but positive (DNB) and severe (TNB, tetryl) eye irritation potentials in rabbits were noted. The sensitization tests showed that DNB and tetryl are not skin sensitizers while TNB caused mild allergic reaction in guinea pigs (Fitzgerald et. al., 1992 a,b,c). Some of the toxicological effects of DNB are: formation of methemoglobin, testicular degeneration and reproductive failure, weight loss and anemia in hamsters, rats and mice. Neurological and hematological disorders have also been reported in dogs. DNB is toxic to humans; the estimated lethal dose range is 5-50 mg/kg. It is readily absorbed through the skin (Von Burg, 1989). Tetryl was observed to be a powerful skin sensitizer in ammunition plant workers. Dermatitis, liver atrophy, spleen effects, headaches, weight loss and respiratory irritation were reported following tetryl exposure (U.S. EPA, 1990). Atmospheric concentration of 1.5 mg/m³ or below did not produce systemic poisoning in persons working with tetryl. DNB, TNB, and tetryl have been shown to be genotoxic in the Salmonella mutagenesis assay (McGregor et. al., 1989). TNB has also been shown to form adducts of blood proteins and tissue DNA in rats (Reddy et. al., 1991).

Objective of the Study

This study was conducted in order to evaluate the toxicity of tetryl when administered in the diet for 90 days.

MATERIALS AND METHODS

Test Material Preparation

N-Methyl-N, 2,4,6-Tetranitroaniline powder (CAS #479-45-8) 99.45% purity was prepared by Dr. W. Koppes of the Naval Surface Warfare Center. The purity was confirmed by the U.S. Army Biomedical Research and Development Laboratory and the U.S. EPA. Analysis by HPLC revealed no detectable impurities. Certified powdered Purina Laboratory Chow 5002 was purchased (Ralston-Purina Co., St. Louis, MO) and stored at 4°C until used. Tetryl diets were prepared weekly. First, 4.5 g of tetryl was added to 50 g of powdered diet in a mortar and thoroughly ground with a pestle. Afterwards 1450 g of the diet was added and mixed for 2 hours in a mechanical mixer (Kitchen Aid, St. Joseph, MI) for uniform distribution. This was verified by determining the tetryl concentration in the diet, taken from each of the 1 kg mixtures, by quantitative analysis done by HPLC. The premixed diet was further diluted with fresh powdered diet to obtain the desired tetryl concentration in the lower dose groups. The diet feeders were refilled twice a week and changed weekly.

Analyses of the tetryl-feed mixtures were carried out on acetone extracts of the mixtures, utilizing a Waters 600E chromatography system (Waters, Milford, MA), equipped with a 490E programmable multiwavelength detector, operating at 245 nm. The entire chromatography system was interfaced with a Berthold HPLC computer program, Version 1.65 (Berthold, Nashua, NH). The tetryl was eluted from a Zorbax C-8 column (9.4 mm x 25 cm) (MAC-DOD Analytical, Chadds Ford, PA) with a water-methanol gradient, at a flow rate of 3 ml/min. The gradient had an initial condition of 20% methanol which was increased in a linear fashion from 20% to 50% in 15 minutes and then to 65% in 25 minutes, and finally to 100% in 10 minutes. The column was washed for an additional 5 minutes and brought back to 20% methanol by reverse gradient and equilibrated for an additional 10 minutes at initial conditions before the next sample was injected. Working standards were prepared in Burdick and Jackson HPLC grade high purity methanol (Baxter, Oletz, OH). Analytical data of these mixtures is presented in Appendix I.

Animals and Maintenance

Male and female Fischer 344 rats, confirmed free of viral antibodies, bacteria and parasites, were obtained from Charles River Laboratories, Kingston, New York. The animals, 6-7 weeks old and weighing approximately 125 g when delivered, were held for 1 week in quarantine prior to initiation of treatment. The animals were housed in a temperature (20-22°C) and humidity (40-60%) controlled room on a 12:12 hour light:dark cycle. For the study, they were housed individually in polycarbonate cages and water was administered ad libitum. Animal identification was done using electronic implants (Bio Medic, Maywood, NJ) with the rats assigned to control and treatment groups according to a computer-generated set of random numbers. The weight variation of the animals of each sex used did not exceed ± 2 s.d. of the mean weight at the time of delivery. The cages were identified with a color-coded identification card indicating the animal and treatment

group. All aspects of the study were conducted in compliance with the guidelines of the American Association for Accreditation of Laboratory Animal Care.

All rats were observed twice daily for physiological and behavioral responses as well as for mortality or morbidity. Food and water consumption were recorded twice weekly. Body weights were taken prior to the start of the study, once weekly during the study and at the final sacrifice.

Experiment Design

Group	No. of Animals	Sex	Dose Groups (mg tetryl/kg diet)
1	10	F	3000
2	10	F	1000
3	10	F	200
4	10	F	0
5	10	M	3000
6	10	M	1000
7	10	M	200
8	10	M	0

Hematology and Clinical Chemistry

Hematology and clinical chemistry analyses were done on days 45 and 90. Hematology parameters were assessed using a Serono-Baker Hematology Analyzer, Model 9000, coupled to a computer running Labcat® software (Innovation Programming, Inc., Princeton, NJ). Total red and white blood cell counts, platelet count, differential leukocyte count, hemoglobin, and packed cell volume were measured and computed. Methemoglobin samples were analyzed on a IL 482 Co-Oximeter. Heinz bodies were determined using the crystal violet procedure (Lee et. al., 1993) with microscopic examination for positive cells (>5 Heinz bodies).

Clinical chemistry was performed using a Cobas Fara II centrifugal analyzer (Roche, Nutley, NJ) with a non-selective electrode (ISE) module. This system was also interfaced with a personal computer and the Labcat software system. Clinical chemistry analytes included sodium, potassium, total protein, albumin, calcium, phosphorus, total bilirubin, blood urea nitrogen, creatinine, alanine aminotransferase, aspartate aminotransferase, glucose, cholesterol, triglycerides and alkaline phosphatase.

Statistical Evaluation

Males and females were considered separately in all statistical analyses. A one-factor (dose) analysis of variance (ANOVA) was used to analyze normally-distributed measures: body weights, organ weights, organ weight ratios, food and water consumption, hematology and clinical chemistry. When a treatment effect was noted ($p \leq 0.05$, F-test) the difference between the control and the treatment groups was probed using a multiple comparison procedure (Dunnett's t-test).

Necropsy and Histopathology

Prior to necropsy, the animals were anesthetized with pentobarbital (60 mg/kg b.w., i. p.) and blood samples were collected via cardiac puncture after the body weight was recorded. Following euthanasia via exsanguination, all external surfaces, orifices, external surface of the brain, cervical tissues, all organs, and the thoracic, abdominal and pelvic cavities were examined for gross lesions.

During necropsy the following tissues were weighed: brain, liver, spleen, kidneys, adrenals, lungs, thymus, testes w/epididymides, ovaries, and heart.

The following tissues were harvested from each animal and preserved in 10% neutral buffered formalin:

skin	colon
mandibular and	cecum
mesenteric lymph nodes	rectum
mammary glands	liver
thigh muscle	pancreas
sciatic nerve	spleen
sternum	kidneys
femur with marrow	adrenals
thymus	urinary bladder
trachea	seminal vesicles
lungs with bronchi	prostate
heart and aorta	testes, including epididymides
thyroid	ovaries
parathyroids	uterus
esophagus	nasal cavity with turbinates
stomach	brain
duodenum	pituitary
jejunum	preputial or clitoral glands
tongue	Zymbal's gland
salivary gland	thoracic spinal cord
ileum	harderian gland
eyes	

Subsequently, these tissues were trimmed, processed and embedded in paraffin. Blocks were sectioned at 5 μ and slides were prepared and stained with hematoxylin and eosin. All tissues were examined in the high dose and control groups of both sexes. The spleen and kidneys were identified as target organs and examined in the appropriate groups.

The inflammatory and degenerative lesions were graded according to severity using a scale of one to four (minimal, mild, moderate or marked). Data were tabulated according to individual animal and summarized by group. In addition, the gross observations and microscopic diagnoses were correlated for each animal. Labcat histopathology software was used for data management.

Specimen, Raw data, and Final Report Storage

All tissue specimens, blocks and slides, raw data and final report will be placed in the U.S. EPA storage facility.

RESULTS

Food and Water Consumption

Overall food and water consumption data are listed in Table 1, while weekly data is given in Appendix A. The food consumption was significantly ($p \leq .05$) reduced in all treatment groups of both sexes while water consumption was increased in the high dose (3000 mg tetryl) female group only.

Using the food consumption data, the average daily tetryl dose levels received by group (see Experimental Design) are presented in Table 2.

Body Weights, Organ Weights and Weight Ratios

The mean group values for body weights are listed in Table 3 while mean group organ weights (heart, brain, spleen, adrenals, thymus, ovaries/testes, kidneys, lungs and liver) are given in Tables 4 (females) and 5 (males). Mean group values for organ to body weight ratios and terminal body weights are present in Tables 6 (females) and 7 (males). Individual body weights are found in Appendix B with individual organ weights present in Appendix C.

Significant ($p \leq 0.05$) decreases in terminal body weights were noted in both sexes receiving 3000 mg/kg tetryl diet and in females receiving 1000 mg/kg.

Absolute and relative organ weights were significantly ($p \leq 0.05$) different from controls for the following organs:

- Kidneys - An increased relative weight was noted in all treatment groups of both sexes except the male 200 mg tetryl dose group.
- Liver - The 3000 mg tetryl dose group of both sexes had increased absolute and relative weights while the 1000 mg/kg dose group of both sexes had only an increased relative weight.
- Spleen - The 3000 mg tetryl dose group of both sexes had an increased relative weight with the male group also having an increased absolute weight.
- Brain - The 3000 mg tetryl dose group of both sexes had a decreased absolute weight with the female 1000 mg/kg dose group also being decreased.
- Adrenals and Thymus - The female 3000 mg tetryl dose group had a decreased absolute weight for both organs while the 1000 mg/kg female dose group also had a decreased adrenal weight.

Hematology

Hematology analyses performed were total white blood cell count (WBC), platelet count, red blood count (RBC), methemoglobin (MetHb), hemoglobin (HGB), hematocrit (HCT), reticulocytes, Heinz bodies and differential leukocyte count for 45 and 90 days. Group data are summarized in Tables 8-11. Individual data are listed in Appendix D.

1. WBC and Differential:
At 45 days, there were no significant changes while at 90 days the female 200 mg tetryl dose group had a significant ($p \leq 0.05$) decreased WBC value.
2. RBC:
At 45 days, females receiving 3000 mg tetryl had a significant ($p \leq 0.05$) decreased RBC while at 90 days both sexes were decreased in this same dose group.
3. Hemoglobin:
At 45 days, females in the 3000 and 1000 mg tetryl dose groups had significantly ($p \leq 0.05$) decreased hemoglobin values as well as males in the 3000 mg dose group. At 90 days both sexes receiving 3000 and 1000 mg tetryl had decreased values.
4. Hematocrit:
At 45 days, there were no significant changes while at 90 days males receiving 3000 and 1000 mg tetryl had significantly ($p \leq 0.05$) decreased hematocrit values.
5. Platelets:
At 45 days, males in the 3000 and 1000 mg tetryl dose groups had significantly ($p \leq 0.05$) increased platelet levels. At 90 days, females in these same dose groups also had increased values. A similar increase was evident in males receiving 3000 mg tetryl.
6. Reticulocytes:
At 45 and 90 days, both sexes dosed at 3000 mg tetryl had significantly ($p \leq 0.05$) increased reticulocyte values as well as females receiving 1000 mg tetryl for 90 days.
7. Methemoglobin:
At both 45 and 90 days, both sexes receiving 3000 and 1000 mg tetryl had significantly ($p \leq 0.05$) increased methemoglobin levels in addition to the 200 mg female group at 45 days.
8. Heinz Bodies:
Were not detected in any group at either 45 or 90 days.

Clinical Chemistry

The mean group values for each analyte are compiled in Tables 12-15. Individual data are present in Appendix E.

1. Total Protein:
At 45 days, all male groups receiving tetryl had significantly ($p \leq 0.05$) increased levels of total protein while at 90 days both sexes in the 3000 and 1000 mg tetryl groups had increased values.
2. Albumin:
At 45 and 90 days, males receiving 3000 and 1000 mg tetryl had significantly ($p \leq 0.05$) increased values for albumin while all treated female groups at 90 days only were increased.
3. Calcium:
At 45 and 90 days, males receiving 3000 and 1000 mg tetryl had significantly ($p \leq 0.05$) increased calcium levels.
4. Total Bilirubin:
At 45 days, females in the 3000 mg tetryl dose group had a significantly ($p \leq 0.05$) increased total bilirubin value while at 90 days both sexes receiving 3000 and 200 mg tetryl had increased levels in addition to the 1000 mg male group.
5. Blood Urea Nitrogen (BUN):
There were no significant differences amongst the groups at either 45 or 90 days except for a slight increase in the 1000 mg male group at 90 days.
6. Creatinine:
At 45 days, females receiving 3000 and 1000 mg tetryl had significantly ($p \leq 0.05$) increased values while at 90 days no changes were noted amongst any of the groups.
7. Aspartate Aminotransferase (AST):
There were no significant differences amongst the groups at either 45 or 90 days except for a slight increase in the 200 mg female group at 90 days.
8. Alanine Aminotransferase (ALT):
There were no significant differences amongst the groups at either 45 or 90 days.
9. Alkaline Phosphatase (ALK Phos):
At 45 days, there were no significant changes while at 90 days all male groups receiving tetryl and the female high dose group (3000 mg tetryl) had significantly ($p \leq 0.05$) decreased values.

10. Sodium:
There were no significant differences amongst the groups at either 45 or 90 days.
11. Potassium:
At 45 days, the male group receiving 3000 mg tetryl had a significantly ($p \leq 0.05$) increased value while at 90 days none of the groups displayed any changes.
12. Glucose:
There were no significant changes amongst the groups at either 45 or 90 days except for a slight increase in the 1000 mg female group at 90 days.
13. Phosphorus:
There were no significant changes amongst the groups at either 45 or 90 days.
14. Cholesterol:
At 90 days, cholesterol was significantly ($p \leq 0.05$) increased at all dose levels in both sexes.
15. Triglycerides:
At 90 days, females receiving 3000 mg tetryl had a significantly ($p \leq 0.05$) reduced triglyceride level.

Clinical Observations

Clinical observations are listed in Appendix F. There were no clinical observations that were meaningful.

Mortality

There were no early deaths in any of the groups.

Ophthalmology Findings (Appendix H)

All animals used in this study were affected with mild corneal dystrophy prior to the initiation of the study which is a common finding in Fischer 344 rats of both sexes. In the time since performing the initial ophthalmic examination the corneal dystrophy lesions had not progressed except in one animal. The remaining abnormalities were sporadic and did not appear to be a dose-related effect.

Gross Pathology

Gross changes noted at the terminal sacrifice were not remarkable.

Histopathology (Appendix G)

All tissues were histopathologically examined in control and high dose animals. The spleen and kidneys were examined in all remaining groups of both sexes.

The spleen was characterized in both sexes in the 3000 mg tetryl dose group by prominent deposition of intra- and extracellular pigment (probable hemosiderin). Also, males in this same dose group showed excessive erythroid cell hyperplasia.

Pigment deposition was also evident in high and mid dose groups (3000 and 1000 mg tetryl) involving the renal cortical epithelium of both sexes. Kidneys in males were further characterized by a dose related increased severity of tubular degeneration and regeneration, hyaline casts, and cytoplasmic droplets. These droplets were morphologically similar to the hyaline droplets noted in the 14 day tetryl study except for a diminished intensity of eosinophilic staining. The remaining diagnoses as listed in the tables should be considered spontaneous since their incidence or severity levels were low.

SUMMARY

The administration to Fischer 344 rats of N-Methyl-N, 2,4,6-Tetranitroaniline at various doses in the diet for ninety days resulted in the following significant findings:

1. A significant decrease in food consumption in both sexes at all dose levels (3000, 1000 and 200 mg tetryl).
2. Terminal body weights were significantly decreased in both sexes in the 3000 mg tetryl dose group and in the female 1000 mg dose group.
3. Relative organ weights were significantly increased in both sexes in the 3000 and 1000 mg tetryl dose groups for liver and kidneys while the spleen was increased in only the 3000 mg dose group.
4. Methemoglobin levels and reticulocytes were significantly increased in both sexes in the 3000 and 1000 mg tetryl dose groups except in females receiving 1000 mg tetryl (reticulocytes).
5. The red blood cell count was significantly decreased in both sexes in the 3000 tetryl dose group while hemoglobin levels were decreased in both the 3000 and 1000 mg dose groups.
6. Cholesterol was significantly increased in both sexes at all dose levels while alkaline phosphatase was decreased in all male groups and the high dose female group (3000 mg tetryl).
7. Albumin levels were significantly increased in both sexes at all dose levels except the female 200 mg tetryl group while total bilirubin was increased at all dose levels except in the female 1000 mg group.

8. The high dose group (3000 mg tetryl) featured prominent splenic pigment deposition along with erythroid cell hyperplasia while males receiving 3000 and 1000 mg tetryl demonstrated increased renal tubular degeneration and regeneration along with obvious cytoplasmic droplets.
9. A no observed adverse effect level (NOAEL) of 13 mg/kg/day was established even though several analytes (hematological and clinical chemistries) in the 200 mg/kg dose group appeared statistically significant, they were not biologically meaningful since the values were within an accepted normal reference range.

APPENDIX F

CLINICAL OBSERVATIONS

CLINICAL OBSERVATIONS

DATE	DAILY OBSERVATIONS
01/12/94	Initial food, water, and animals weighed for the females. Feeders changed. All animals look normal.
01/13/94	Initial food, water, and animals weighed for the males. Feeders changed. All animals look normal.
01/18/94	Food, water, and animals weighed for both females and males. Feeders changed. All animals look normal.
01/19/94	All animals look normal.
01/20/94	All animals look normal.
01/21/94	Food and water weighed for the both females and males. All animals look normal.
01/24/94	All animals look normal.
01/25/94	Food, water, and animals weighed for the both females and males. All animals look normal.
01/26/94	All animals look normal.
01/27/94	All animals look normal.
01/28/94	Food and water weighed for the both females and males. All animals look normal.
01/31/94	All animals look normal.
02/01/94	Food, water, and animals weighed for the both females and males. All animals look normal.
02/02/94	All animals look normal.
02/03/94	All animals look normal.
02/04/94	Food and water weighed for the both females and males. All animals look normal.
02/07/94	All animals look normal.
02/08/94	Food, water, and animals weighed for the both females and males. All animals look normal.
02/09/94	All animals look normal.
02/10/94	All animals look normal.
02/11/94	Food and water weighed for the both females and males. All animals look normal.

CLINICAL OBSERVATIONS

03/02/94	All animals look normal.
03/03/94	All animals look normal.
03/04/94	Food and water weighed for the both females and males. All animals look normal.
03/07/94	All animals look normal.
03/08/94	Food, water, and animals weighed for the both females and males. Feeders changed. All animals look normal.
03/10/94	All animals look normal.
03/11/94	Food and water weighed for the both females and males. All animals look normal.
03/14/94	All animals look normal.
03/15/94	Food, water, and animals weighed for the both females and males. Feeders changed. All animals look normal.
03/17/94	All animals look normal.
03/18/94	Food and water weighed for the both females and males. All animals look normal.

CLINICAL OBSERVATIONS

DATE	DAILY OBSERVATIONS
03/21/94	All animals look normal.
03/22/94	Food, water, and animals weighed for the both females and males. Feeders changed. All animals look normal.
03/23/94	All animals look normal.
03/24/94	All animals look normal.
03/25/94	Food and water weighed for the both females and males. All animals look normal.
03/28/94	All animals look normal.
03/29/94	Food, water, and animals weighed for the both females and males. Feeders changed. All animals look normal.
03/30/94	All animals look normal.
03/31/94	All animals look normal.
04/01/94	Food and water weighed for the both females and males. All animals look normal.
04/04/94	All animals look normal.
04/05/94	Food, water, and animals weighed for the both females and males. Feeders changed. All animals look normal.
04/06/94	All animals look normal.
04/07/94	All animals look normal.
04/08/94	Food and water weighed for the both females and males. All animals look normal.
04/11/94	All animals look normal.
04/12/94	Final food and water weights taken. Animals weighed. #1-#40 females taken off food for sacrifice 4-13-94. All animals look normal.
04/13/94	Final food and water weights taken. Animals weighed. #41-#80 males taken off food for sacrifice 4-14-94. Animals 1-40 were sacrificed. All other animals look normal.
04/14/94	Animals 41-80 were sacrificed.

(END OF REPORT)

APPENDIX H
OPHTHALMOLOGY
DATA

Ophthalmology Report

David A. Wilkie DVM, MS
Diplomate ACVO

Introduction

The following are results of ocular examinations. All ocular examinations were performed by a Board-Certified Veterinary Ophthalmologist.

Materials and Methods

A preliminary ophthalmic examination was performed on the eyes of all rats by Dr David Wilkie DVM, MS, Dip. ACVO prior to initiation of the study. Examinations included:

1. Biomicroscopic examination, using a Zeiss HSO-10 biomicroscope, following dilation of the pupils with 1.0% tropicamide (Mydracyl®).
2. Indirect ophthalmoscopic examination, using a 30 diopter lens, following dilation of the pupils with 1.0% tropicamide (Mydracyl®).

Results

Initial Examination

Corneal dystrophy (crystals) -

The eyes of all animals examined were affected by corneal dystrophy/crystals. All animals were affected with mild corneal dystrophy OU.

Conclusions

All animals to be used in this study are affected with mild corneal dystrophy prior to the initiation of the study. Corneal dystrophy is a common finding in Fisher 344 rats of both sexes. In a 90 day study such as this the corneal lesions should not progress significantly and do not interfere with examination of the intraocular tissues.

Ophthalmology Report

David A. Wilkie DVM, MS
Diplomate ACVO

Introduction

The following are results of ocular examinations. All ocular examinations were performed by a Board-Certified Veterinary Ophthalmologist.

Materials and Methods

A final ophthalmic examination was performed on the eyes of all rats by Dr David Wilkie DVM, MS, Dip. ACVO prior to completion of the study. Examinations included:

1. Biomicroscopic examination, using a Zeiss HSO-10 biomicroscope, following dilation of the pupils with 1.0% tropicamide (Mydracyl®).
2. Indirect ophthalmoscopic examination, using a 30 diopter lens, following dilation of the pupils with 1.0% tropicamide (Mydracyl®).

Results

Initial Examination

Corneal dystrophy (crystals) -

The eyes of all animals examined were affected by corneal dystrophy/crystals. All animals were affected with mild corneal dystrophy OU with the exception of the right eye of animal #46 where the corneal dystrophy was moderate in severity.

Conjunctivitis (mild) -

Mild conjunctivitis was noted in animal #80 and involved the left eye.

Conclusions

All animals used in this study were affected with mild corneal dystrophy prior to the initiation of the study. Corneal dystrophy is a common finding in Fisher 344 rats of both sexes. With the exception of animal #46 the corneal dystrophy has not progressed. The conjunctivitis noted in animal #80 is an incidental finding. There is no treatment or group effect observed.

APPENDIX J

PROTOCOL AND
AMENDMENTS

PROTOCOL

90-Day Subchronic Toxicity Evaluation of N-Methyl-N,2,4,6-Tetranitroaniline in Male and Female Fischer (F344) Rats

This study will be conducted in agreement with Good Laboratory Practice Standards, Environmental Protection Agency, Toxic Substances Control Act (TSCA) 40 CFR Part 792 (Federal Register, Vol 54, No. 158, August 17, 1989, pp. 34034 - 34050). All aspects of the studies will be conducted in accordance with written Standard Operating Procedures (SOP) of the performing unit and all raw data and performance documents will be maintained in agreement with GLP. An administratively separate quality assurance unit (QAU from PAI) will monitor the studies to assure adherence to good laboratory practices and the approved SOPs. Any deviation from the protocol or GLP will be noted in the raw data and reflected in the final report.

TITLE: 90-DAY SUBCHRONIC TOXICITY EVALUATION OF N-METHYL-N,2,4,6-TETRANITROANILINE IN MALE AND FEMALE FISCHER (F344) RATS

BACKGROUND:

Nitroaromatics, such as 1,3-dinitrobenzene (DNB), 1,3,5-trinitrobenzene (TNB), and N-methyl-N,2,4,6-tetranitroaniline (tetryl), have been detected as environmental contaminants of groundwater and soil near production sites and in some instances at military test grounds. The wastewaters discharged from trinitrotoluene (TNT) manufacturing processes contain a variety of aromatic compounds, including DNB and TNB. TNB is formed during the nitration step of TNT synthesis as a result of oxidation of methyl groups. Although the complete mechanism of TNB formation during TNT photolysis is unknown, Burlinson (1980) suggested that it is produced by decarboxylation of 2,4,6-trinitrobenzaldehyde, a major TNT photoproduct. It is also found in aquatic systems and surface soils as a by-product of photolysis of TNT. DNB and TNB are not easily biodegradable, persist in the environment, eventually leach out, and contaminate groundwater near waste disposal sites. Tetryl is an explosive that has been in use, largely for military purposes, since 1906. Wastewaters and soil at the original production sites and other plants devoted to munitions assembly, contain large quantities of tetryl. A recent estimate of tetryl in wastewaters generated from the production of tetryl at Joliet Army Ammunition Plant was about 36 lb/per day of each production line.

Toxicity data on these compounds are limited. The oral LD50 of DNB, TNB and tetryl were 59 mg/kg, 284 mg/kg and greater than 5 g/kg, respectively, in rats for combined sexes. TNB and tetryl were not toxic at 2 g/kg when applied to rabbit skin for 24 hours. However, the dermal LD50 of DNB was 1.99 g/kg for combined sexes of rabbits. None of these compounds produced skin irritation potentials but positive (DNB) and severe (TNB, tetryl) eye irritation potentials in rabbits. The sensitization tests showed that DNB and tetryl are not skin sensitizers while TNB caused mild allergic reaction in guinea pigs. Some of the toxicological and behavioral effects of DNB are; formation of methemoglobin, testicular degeneration and reproductive failure, and weight loss and anemia in hamsters, rats and mice. Neurological and hematological disorders have also been reported in dogs. DNB is rather toxic to humans; the estimated lethal dose range is 5-50 mg/kg. It is readily absorbed through the skin. Fetal doses (amount and route of administration are not given) of tetryl produced toxic degeneration (necrosis) in the kidneys of dogs and rabbits and liver necrosis in dogs (not in rabbits). Tetryl was observed to be a powerful skin sensitizer in ammunition plant workers. Hardy and Maloof (1950) reported effects from accidental exposure of 11 people to tetryl: two died, one was disabled and eight did not detect permanent disability. They also reported irreversible liver damage, dermatitis, and upper respiratory irritation following tetryl exposure. The effects of tetryl exposure include gastrointestinal symptoms and epidermal, respiratory, nervous system, hematopoietic and circulatory injury. Atmospheric concentration of 1.5 mg/m³ or below did not produce systemic poisoning in persons working with tetryl. DNB, TNB, and tetryl have been shown to be genotoxic in *Salmonella* mutagenesis assay. TNB has been shown to form adducts of blood proteins and tissue DNA in rats.

PROTOCOL

1. Study. 90-day Subchronic toxicity evaluation with N-Methyl-N,2,4,6-tetranitroaniline (tetryl) in F344 male and female rats.
2. Purpose. To evaluate subchronic toxicity of tetryl when administered in the diet for 90-days.
3. Study Location. Andrew W. Breidenbach Environmental Research Center, U.S. Environmental Protection Agency, Cincinnati, OH 45268
4. Sponsor and Address. U.S. Army Biomedical Research and Development Laboratory, Fort Detrick, Frederick, Maryland 21701-5010
5. Principle Investigator. T.V. Reddy, Ph.D., Research Chemist Environmental Monitoring Systems Laboratory, U.S. Environmental Protection Agency, Cincinnati, Ohio 45268
6. Co-Principle Investigator. F. Bernard Daniel, Ph.D, Environmental Monitoring Systems Laboratory, U.S. Environmental Protection Agency, Cincinnati, Ohio 45268
7. Study Coordinator. Barry Wiechman, MS., Pathology Associates (ROW)
8. Project Manager. G.R. Olson, DVM, Ph.D., Pathology Associates (PAI)
9. Regulatory Compliance. This study is carried out according to U.S. EPA Health Effects testing guidelines (40 CFR 798) in compliance with GLP (40 CFR 792)
10. Quality Assurance. The protocol in life phase and final report will be audited by the Quality Assurance Office in accordance with SOP's at Pathology Associates, West Chester, Ohio 45069.
11. Test Material. N-Methyl-N,2,4,6-tetranitroaniline (tetryl) (CAS#479-45-8) is supplied by the U.S. Army Biomedical Research and Development Laboratory, Ft. Detrick, Frederick, Maryland 21702. The sponsor will be responsible for the purity of the test chemical.
12. Experimental Design.
 - A. Selection of Dose: An appropriate dose will be selected from 14-day range finding study. Toxikon Corporation, Woburn, MA 01801 has conducted acute toxicity studies on Tetryl. They administered Tetryl in corn oil to

rats at a single oral (Bolus) dose and observed the clinical signs for 14 days following dosing. They have reported that tetryl is nontoxic even at dose levels of 5 g/kg B.W. No unusual lesions were reported at necropsy in male and female rats. There were no established reports on the LD50 values. There are no reports on the chronic effects of tetryl in rats. Therefore, a pilot study is designed to determine the palatability.

B. Preparation of the Diet: Certified powdered Purina laboratory chow purchased from Purina labs and stored at 4°C is used. Analysis of the feed for each batch is supplied by the manufacturer. Feed analysis data suggests that the contaminants reported in feed do not have adverse effects on the test. Tetryl diets are prepared once a week. Just before the diet preparation, tetryl is removed from the storage shelves (kept in designated carcinogen room), weighed in the carcinogen room and mixed with the powdered diet (10g/kg/diet g/kg). First, 10g tetryl granules are powdered by grinding in a pestle and mortar and then mixed with 250g powdered diet and mixed for 15 min. Then an additional 250 g of powdered diet is added and mixed for an additional 15 min. Then the remaining diet will be added to bring the tetryl concentration to 10 g/kg; then mixed for an additional hour in a mechanical stirrer (Kitchen Aid heavy duty stand mixer, Model No. K5SS) for uniform distribution of tetryl in the diet. This is also verified by determining the tetryl concentration in the diet taken from three different depths (top, middle and bottom layer) of the mixing chamber. Quantitative analysis of tetryl is done by HPLC.

The premixed diet (10 g/kg) is further diluted with fresh powdered diet to obtain the desired tetryl concentration in the diet as determined from 1x day range finding study. Individual diet concentrations are determined as described before. Tetryl concentrations are manipulated in such a way that each rat (caged individually) will receive the desired amount of tetryl. This is determined by calculating the daily average intake, followed by an adjustment of tetryl content in the diet. Dietary intake and water consumption are measured twice a week. Body weights are recorded once a week.

C. Animal Husbandry: Animals will be housed 2 per cage in suspended stainless steel cages. All housing and care will be carried out according to the standards recommended by the Guide for the Care of Laboratory Animals (DHHS Publication No. (NIH) 86-23, 1989).

D. Randomization: Using computer-generated random numbers with assignment to groups. At the time of randomization, the weight variation of the animals of each sex used should not exceed ± 2 SD of the mean weight, and the mean body weights for each group of each sex will not be statistically different.

E. Justification: Rats (6-8 weeks old) historically have been used in safety evaluation studies and are recommended by appropriate regulatory agencies.

F. Test Species: Fisher 344 rats (50 male and 50 female, 6-7 weeks old) will be obtained from the Charles River Labs, Inc., Portage, MI. All

animal identification is made by using electronic implants. Cage cards and diet preparations will be color-coded by dose groups. Distilled water will be provided *ad libitum* using water bottles with stainless double ball sipper tabs. Upon arrival, the animals will be quarantined for one week. During the quarantine period, the animals will be observed for fitness and serology tests will be performed. Animals with any pathological signs will not be included in the study.

G. Group designation and dose levels for 90-day toxicity study:

Group	No. of Rats	Sex	Tetryl Conc. in the Diet g/kg	Tetryl mg/kg/diet	Sacrifice Time (days)
1	10	Male	0	0	90
2	10	"	A*	3000	90
3	10	"	B	1000	90
4	10	"	C	200	90
5	10	Female	0	0	90
6	10	"	A	3000	90
7	10	"	B	1000	90
8	10	"	C	200	90

*A, b, c will be determined from 90 day range finding study.

H. Analysis of the Diet: The stability and the homogeneity of tetryl in the diet is determined by analyzing the tetryl content (by HPLC) in the diet, soon after diet preparation and after each feeding intervals.

I. Observation of Animals:

(1) Clinical Observations:

Twice daily - mortality and morbidity check.

Once daily - cageside observation for obvious indications of a toxic effect; these effects will be recorded as they are observed.

Data for mortality and morbidity checks and cageside observations will be recorded on the same form. Because these are cageside animal checks, the observations will not be as specific and may not necessarily duplicate those observations recorded on body weight days when thorough physical examinations are conducted.

(2) Physical Examinations: At each weighing interval - These observations will include, but not be limited to, changes in: skin and

fur; eyes and mucous membranes; respiratory, circulatory, autonomic and central nervous systems; some motor activity and behavior.

(3) Body Weight: Prior to treatment and weekly, thereafter.

(4) Food Consumption: Weekly - twice.

(5) Water Consumption: Weekly - twice.

(6) Ophthalmoscopic examination: Prior to the treatment and the termination by a board certified veterinarian

J. Clinical Pathology:

(1) Frequency: At termination.

(2) Number of Animals: All animals.

K. Tests:

(1) Hematology:

leukocyte count	methemoglobin
erythrocyte count	hematocrit
heinz bodies	platelet count
hemoglobin	differential leukocyte count

(2) Blood Chemistry:

glucose	urea nitrogen
sodium	creatinine
potassium	aspartate aminotransferase
total protein	alanine aminotransferase
albumin - phosphorus	alkaline phosphatase
calcium	
total bilirubin	

L. Termination:

(1) Unscheduled Sacrifices and Deaths: Necropsies, by trained personnel using procedures approved by board-certified pathologists, will be conducted on all moribund animals and on all animals that die.

(2) Sacrifice: After 90 days of treatment, all surviving animals will be weighed, anesthetized with sodium pentobarbital, and exsanguinated. Necropsies will be conducted on each animal in a random order to eliminate bias by trained personnel using procedures approved by board-certified pathologists. Animals will be fasted for 12 hrs before sacrifice.

A pathologist will be readily available for consultation (further participation by a pathologist is available).

M. Postmortem Procedures:

(1) Gross Necropsy: The necropsy will include examination of:

external surface
all orifices
cranial cavity
carcass
external surface of the brain (at necropsy) - cut surfaces of the brain
thoracic, abdominal and pelvic cavities and their viscera
cervical tissues and organs

(2) Organ Weights: For each terminally sacrificed animal, the following organs (when present) will be weighed following careful dissection and trimming to remove fat and other contiguous tissue in a uniform manner:

brain	lungs
liver	thymus
spleen	testes with epididymides/ovaries
kidneys	heart
adrenals	

(3) Tissue Preservation: The following tissues (when present) from each animal will be preserved in 10% neutral buffered formalin:

skin	ileum
mandibular lymph nodes	colon
mesenteric lymph nodes	cecum
mammary glands	rectum
thigh muscle	liver
sciatic nerve	pancreas
sternum with marrow	spleen
femur with marrow	kidneys
larynx	adrenals
thymus	urinary bladder
trachea	seminal vesicles
lungs and bronchi	prostate
heart and aorta	testes, including epididymis
thyroid	ovaries
parathyroids	uterus
esophagus	nasal cavity and nasal turbinates
stomach	brain
duodenum	pituitary
jejunum	preputial or clitoral glands
tongue	Zymbal's gland
salivary gland	thoracic spinal cord

N. Histopathology:

(1) Following necropsy, a list of all gross lesions recorded will be submitted to the project officer at U.S. Army Biomedical Research and Development Laboratory for his evaluation and for any additional

histopathology other than those described below.

Histopathological evaluations are to be done on the following tissues from all the animals (male and female from the highest dose group and untreated controls). The tissues examined under a light microscope are as follows:

cerebrum	pancreas
cerebellum	cecum
trachea	colon
thyroid	rectum
parathyroid	stomach
esophagus	skeletal muscle
salivary gland	sciatic nerve
harderian gland	tongue
heart	skin
aorta	mammary gland
lung	nasal region
thymus	sternum
spleen	femur
mesenteric lymph node	vertebrae
liver	spinal cord
kidneys	adrenals
urinary bladder	pituitary
duodenum	eye(s)
jejunum	Zymbal's gland
ileum	

MALE

accessory sex glands
epididymis
testes

FEMALE

uterus
ovaries

An average of 12 slides will be prepared for each rat covering all the tissues shown above (3 or 4 tissues are fixed on each slide). A total of 480 slides from 40 rats (10 male and 10 female from high dose control group) from the 14-day study will be examined. Based on the results from high dose group tissues from other doses, groups will be examined as needed. Following completion of each study, all wet tissues, paraffin blocks and slides will be placed in the EPA storage facility.

0. Final Report:

Two months after the termination of the in-life phase of the study, eight copies of the final report which includes the following information (as appropriate) will be prepared and submitted to the project officer at EPA. Appropriate records are maintained during the test period and returned to the project officer at the completion.

(1) Experimental Design and Methods:

(2) Results:

mortality
clinical observations
body weights
food and liquid consumption
clinical pathology tests

organ weights and organ/body
weight ratios
gross pathology
histopathology

Statistical Evaluation:

Stat-view computer software will be used for statistical analysis.

Dunnet's t-test will be used for comparing the treatment groups.

Kruskal-Wallis rank sums will be used, if needed, to examine the differences among the treatment groups and Wilcoxon rank sum test will be used to analyze pairwise differences between the control and each dose group.

- P. Proposed starting date: January 1994
- Q. Proposed termination date: March 1994
- R. Proposed draft report: June 1994
- S. Final Report due: July 1994.

Amendment 1
for
United States Army Study 94-001
SUBCHRONIC TOXICITY EVALUATION OF N-METHYL-N, 2,4,6-
TETRANITROANILINE IN FISCHER (F344) RATS

For
United States Army
Biomedical Research and Development Laboratory
Fort Detrick
Frederick, MD 21701-5010

The purpose of Amendment 1 is provide data for hematology and clinical chemistries at 45 days.

1. Page 6, add the following:

J. Clinical Pathology
(1) Frequency: At 45 days and termination.

Reason: This statement was incorrect in the original protocol.
